

# CALIBRATING YOUR SPREADER

## *Suggested spreader settings for our Four Step Program products.*

How do I know which spreader setting to use? (For spreaders not listed on the back.)

1. Weigh out an appropriate amount of product to cover 1000 sq. ft.

13-13-13 = 7 pounds  
20-0-5 w/ Dimension = 4.6 pounds  
21-0-4 w/ Merit = 3.5 pounds  
22-0-10 w/ Surge = 4 pounds

2. Set your spreader for a test run. The following recommendations are for the 4 Step products:

13-13-13 = 67% open  
22-0-4 w/ Dimension = 40% open  
21-0-4 w/ Merit = 30% open  
22-0-10 w/ Surge = 35% open

3. Close your spreader; pour in the test run product. Mark where you start. Distribute the product along a long straight area. Walk a straight line while distributing the product. Stop and mark the spot the moment you empty the spreader.

4. Calculate the square footage that you spread the product. (width x length)

5. You should be close to covering 1000 square feet. If you were a little short, close the setting a little. If you covered more, open the settings a little more. Repeat the exercise in a different area until you find the correct setting.

6. Record the correct setting for your long term reference.
